

FINAL PRESENTATION

TEAM TA: TITHIRA WITHANAARACHCHI

26/07/2023

AGENDA

1. Development Environment and Outline of Work.
2. Task 6:Outline.
3. Task 7: Outline.
4. Task 7: Input Structure.
5. Task 7: Class Diagram.
6. Task 7: Concept of the Product Layout .
7. Example Scenario of Shelf and Product Placing.
8. Efficiency of the Proposed Store.
9. Testing and Code Demonstration.
- 10.Deliverables and Difficulties.
- 11.Contribution and the Learning Outcomes.

DEVELOPMENT ENVIRONMENT AND OUTLINE OF WORK

(2ND QUARTER)

Development Environment

Operating System: Windows.

Language: Java.

IDE: Vs Code.

Version Control: Git Hub.

Outline of Work

Task 6: Implemented using both Held Karp and Dijkstra's Algorithm. Held Karp is modified to return the path and distance both.

Task 7: Implemented considering the product pairs bought by customers and their frequency (own algorithm).

TASK 7:OUTLINE

- The task is implemented by own algorithm which considers the frequency of product pairs which was bought together in each order.
- History of the purchases are analyzed and used the output which contains product pairs and its frequencies to create the product Layout.

TASK7: INPUT STRUCTURE

Constraints:

- T->Number of Products is a constant(50).
- Size of the store is 12*12 which can accommodate 60 products

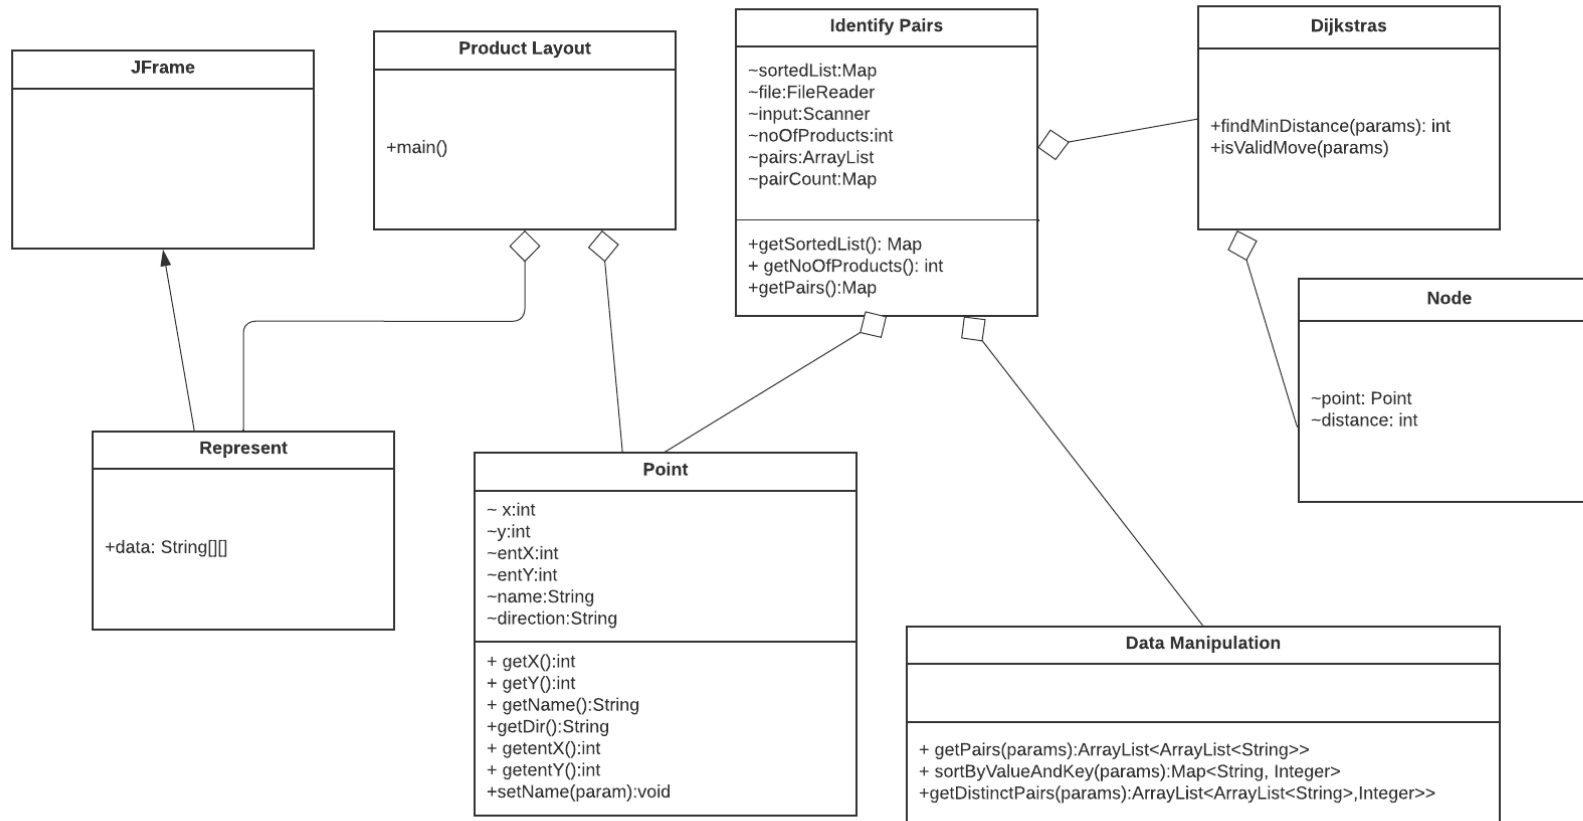

N: Total number of purchases.

T: Total number of products in the store.

i: number of products in the order(purchase).

p: list of products in the order(purchase).

TASK 7:CLASS DIAGRAM

TASK 7: CONCEPT OF THE PRODUCT LAYOUT

Shelf Placing:

0	0	0	0	0	0	0	0	0	0	0	0	0

1	0	0	0	0	0	0	0	0	0	0	1
1	0	0	0	0	0	0	0	0	0	0	1

Reduce the Shelves
According to the
Number of Products

- 0: Empty spaces of the store(Which customers can travel on)
- 1: Obstacles where customers cannot travel on.
- 2: Empty shelves.
- 3: Reduced set of shelves placed according to the number of products.

Example Scenario: Shelf Placing

0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0	0	0

Zucchini 49	0	0	Cauliflower 35	<u>Sweetpotato 32</u>	0	0	Coconut 19	Radish 16	0	0	Lemon 2
Mushroom 50	0	0	Kiwi 34	Plum 33	0	0	Spinach 18	Rice 17	0	0	Blueberry 1
1	0	0	0	0	0	0	0	0	0	0	1
1	0	0	0	0	0	0	0	0	0	0	1

PAIR DISTANCE EFFICIENCY OF THE PROPOSED STORE

```
//Calculating Distance Product of Proposed Store
Dijkstra d=new Dijkstra();
for(ArrayList<String> h:sortedList.keySet()){
    ArrayList<Point> plist=new ArrayList<Point>();
    for(int j=0;j<h.size();j++){
        for(int i=0;i<shelves.size();i++){
            if(h.get(j).equals(shelves.get(i).getName())){
                plist.add(shelves.get(i));
            }
        }
    }

    int distance=d.findMinDistance(graph, plist.get(index:0), plist.get(index:1));
    sum=sum+(distance*sortedList.get(h));
}

//Calculating Distance Product of Random Store
for(ArrayList<String> h:list.keySet()){
    ArrayList<Point> plist=new ArrayList<Point>();
    for(int j=0;j<h.size();j++){
        for(int i=0;i<shelves2.size();i++){
            if(h.get(j).equals(shelves2.get(i).getName())){
                plist.add(shelves2.get(i));
            }
        }
    }

    int distance=d.findMinDistance(graph, plist.get(index:0), plist.get(index:1));
    sum2=sum2+(distance*list.get(h));
}

double percentage=((sum2-sum)/sum2)*100;

System.out.println("Distance Product of Proposed Approach : "+ sum);
System.out.println("Distance Product of Random Approach : "+ sum2);
System.out.println("Efficiency of the Proposed Store : "+String.format(format:"%.5f", percentage)+"%");
```

Pair Distance Product=(<distance between 2 products in the pairs list> * <the frequency of the pair>)/ (<distance between entrance and product1 of the product pair>*<distance between entrance and product2 of the product pair>)

Pair Distance Efficiency=((RandomSum-ProposedSum)/RandomSum)* 100

ProposedSum : Sum of “pair distance products” of proposed Store

RandomSum : Sum of “pair distance products” of Random Store

PAIR DISTANCE EFFICIENCY OF THE PROPOSED STORE

```
//Calculating Distance Product of Proposed Store
Dijkstra d=new Dijkstra();
for(ArrayList<String> h:sortedList.keySet()){
    ArrayList<Point> plist=new ArrayList<Point>();
    for(int j=0;j<h.size();j++){
        for(int i=0;i<shelves.size();i++){
            if(h.get(j).equals(shelves.get(i).getName())){
                plist.add(shelves.get(i));
            }
        }
    }

    int distance=d.findMinDistance(graph, plist.get(index:0), plist.get(index:1));
    sum=sum+(distance*sortedList.get(h));
}

//Calculating Distance Product of Random Store
for(ArrayList<String> h:list.keySet()){
    ArrayList<Point> plist=new ArrayList<Point>();
    for(int j=0;j<h.size();j++){
        for(int i=0;i<shelves2.size();i++){
            if(h.get(j).equals(shelves2.get(i).getName())){
                plist.add(shelves2.get(i));
            }
        }
    }

    int distance=d.findMinDistance(graph, plist.get(index:0), plist.get(index:1));
    sum2=sum2+(distance*list.get(h));
}

double percentage=((sum2-sum)/sum2)*100;

System.out.println("Distance Product of Proposed Approach : "+ sum);
System.out.println("Distance Product of Random Approach : "+ sum2);
System.out.println("Efficiency of the Proposed Store : "+String.format(format:"%.5f", percentage)+"%");
```

Approximate Pair Distance Efficiency range of Proposed Store:

0.4% ~ 1.02%

***As the distance between 2 related products reduce, the customer will be convinced to by more products.**

***And as the distance between entrance and the frequently bought products increase, the time that the customer will remain in the store will comparatively increase.**

***Therefore as the distance from entrance to frequently bought products increase, the efficiency of the proposed store increase.**

A black and white photograph of a modern workspace. In the foreground, there is a dark metal desk with a light-colored top. On the desk, there is a computer monitor, a keyboard, and a small potted plant. A black metal chair is positioned in front of the desk. The background is a textured brick wall. A white diagonal line separates the image from the text on the right.

TESTING AND CODE DEMONSTRATION

Testing:

- Black Box Testing Approach.
- Inputs for testing were generated using a test data generator.

Lets Look at the Demo!

The background of the slide is split diagonally from the top-left to the bottom-right. The left half is black with white CSS code snippets, including 'position: absolute; z-index: 999', '5px #ccc}.gbtrl .gbm', 'display: block; position', 'acity: 1; *top: -2px; *le', '/; top: -4px\0/; left: -6', 'e-box; display: inline', 'isplay: block; list-s', 'e-block; line-height', 'pointer; display: bl', 'tive; z-index: 1000)', 'padding-right: 9px', and 'daur]'. The right half is white.

DELIVERABLES (QUARTER 2)

- Code which gives the shortest distance to travel within the store and the path that has to travel in order to achieve that(phase2).
- Optimized Product Layout of a store according to the purchase history of products by customers(Phase3).

DIFFICULTIES

- Working on the project alone.
- Manage Time for completing the task along with the other courses of the semester.

CONTRIBUTION AND THE LEARNING OUTCOMES

Contribution:

Tithira Withanaarachchi: 100%

Learnings:

- Learned the way of using pre-built algorithms in order to achieve the project goals.
- Improved the scope of thinking about a software problem and how to approach them after getting exposed to different algorithm.
- Test data generation.
- Improved the skill of achieving deadlines as possible.

THANK YOU

Team TA
